

Polynomials

when you add two algebraic terms
 $x^2 + 1$ is a polynomial

the degree of the polynomial corresponds to the highest exponent of the terms. If it has multiple variables, you add their exponents
 $x^3 + 2x + 1$ is a 3rd order polynomial, also called a trinomial

$xy + x + 3$ is a second order polynomial, because you add the exponents of the xy to be 2

$3x + 5y + z$ is a first order polynomial

$x^3y + 1$ is a fourth order polynomial, it doesn't have a commonly used name

When you combine like terms, you add the number in front of the variable (coefficient)

$$(3x^2 + 2x + 3) + (4x^2 - 3x - 7) =$$
$$7x^2 - x - 4$$

$$3x^2 + 5x - 3 - (2x^2 - 6x - 5)$$

$$(2)x^2 + (5)x - (3) - (2)x^2 + (6)x + (5)$$

$$x^2 + 11x + 2$$

Polynomials

when you add two algebraic terms
 $x^2 + 1$ is a polynomial - binomial

1 2 Terms

Like terms have the same variables to the same exponent

x^2y is like to yx^2 but not xy

monomial - one term xy degree 2

binomial is two terms $xy + 1$ degree 2

trinomial is three terms $x^2 + xy + 1$ degree 2

degree corresponds to the highest power of the polynomial

x^2y is degree 3 because 2 from x^2 and 1 from y

z^3y^2 is degree 5 because 3 from z^3 and 2 from y^2

convention is to write polynomials in decreasing order of degree

$x^2 + 1$ instead of $1 + x^2$

combining like terms, you add the number in front of the term

Work - in class and at home?

p175-177 left hand side

p178 bonus use $A = \pi r^2$ for a circle (3.14159....)

$x^2y + xy + 5$

Handwritten work for combining like terms:

Original expression: $6xy - 3xy^2$

Annotations:

- An arrow points from "degree 2" to the $-3xy^2$ term.
- An arrow points from "degree 3" to the $6xy$ term.
- A large "3" is written next to the $-3xy^2$ term.

Resulting expression in a box:

$$-3xy^2 + 6xy$$

$$[-3xy^2 + 6xy]$$

horizontal

$$x^2 + 3x + 5 - (2x^2 + 2x - 4)$$

$$x^2 - 2x^2 + 3x - 2x + 5 + 4$$

$$[-x^2 + x + 9]$$

Vertical

$$x^2 + 3x + 5$$

$$- 2x^2 - 2x + 4$$

$$[-x^2 + x + 9]$$
